

Short-term Administrative Sanctions for Alcohol and Drug Use by Drivers

This policy brief is one of a series on current topics related to impaired driving in Canada. Other topics include oral fluid drug screening, mandatory alcohol screening, the drug evaluation and classification program, and drug per se laws. The briefs are not intended to provide a comprehensive and critical review of the literature. Rather, their purpose is to provide a balanced overview of the issue, including a description of any procedure or process involved, an indication of similar measures in other countries, evidence of the effectiveness of such measures, and potential limitations and alternatives. The policy briefs are intended for a broad audience interested in impaired driving issues.

Key Considerations

- Enhanced short-term administrative suspensions, when combined with vehicle impoundment and monetary penalties, are a viable, effective means of reducing the magnitude of the impaired driving problem in Canada. This brief outlines the measures that provinces and territories have taken to help keep impaired drivers off the roads:
- Most jurisdictions have implemented enhanced administrative sanctions, including immediate short-term licence suspension and vehicle impoundment, for drivers with blood alcohol concentrations between 50 and 80 mg/dL.
- The legalization of non-medical cannabis has prompted the expansion of administrative licence suspensions to include drivers affected by drugs.
- Several jurisdictions have enhanced administrative suspensions with a period of vehicle impoundment.
- Zero tolerance for alcohol and drugs for novice drivers with immediate administrative sanctions has become universal across Canada.

The Issue

Ever since Canada introduced a per se blood alcohol concentration (BAC) limit of 80 mg/dL for drivers in 1969, there have been repeated calls to lower the limit to 50 mg/dL, a level more consistent with that in most other industrialized countries around the world. It is argued that a lower limit would help reduce the annual toll of fatalities and injuries associated with driving after drinking. Successive governments have studied the issue and decided to leave the *Criminal Code* limit at 80 mg/dL and encouraged the provinces and territories to deal with drivers with lower BACs in a manner they deemed appropriate within their respective highway traffic legislation.

In recent years, growing concern about drugs and driving has prompted several jurisdictions to expand their program of short-term administrative suspensions to include drivers who are adversely affected by drugs. The criterion for issuing a suspension is either the driver's performance on the Standardized Field Sobriety Test,* the opinion of the police officer that the driver is adversely affected by drugs, or a positive result on approved oral fluid drug screening equipment.

Background

Portable roadside alcohol screening devices (known as approved screening devices or ASDs) have been used by the police in Canada since the mid-1970s. The devices are calibrated to register "Warn" when the alcohol concentration is between 50 and 100 mg/dL (hence the term "Warn range" suspension) and "Fail" when the driver's BAC is over 100 mg/dL. Although the BAC limit in the *Criminal Code* is 80 mg/dL, the upper limit of the "warn" range on the ASDs was set at 100 mg/dL so as to provide some latitude for measurement error.

During the 1980s, provinces and territories began implementing legislation giving police the authority to suspend for a period of 4 to 24 hours the licence of any driver who is affected by alcohol or has a BAC of at least 50 mg/dL. This type of legislation spread across the country and only Quebec and the Yukon Territory do not have immediate roadside suspensions for drivers with a BAC of at least 50 mg/dL. Quebec has a 50 mg/dL limit for drivers of heavy vehicles. Saskatchewan sets the threshold for immediate suspensions at 40 mg/dL.

Immediate short-term suspensions were viewed as a means for getting drivers with BACs below the *Criminal Code* limit off the road. For many, a short-term administrative suspension is the first encounter with law enforcement about drinking and driving and can serve as a warning that drinking drivers will be caught and punished.¹

Over the years, anecdotal evidence along with survey data suggested that immediate short-term suspensions were becoming a convenient alternative for police officers who occasionally would prefer to issue a short-term suspension rather than spend two to three hours processing a criminal impaired driving charge that might have a relatively low probability of a conviction. This use of discretion was a means to avoid the numerous procedural and legal obstacles that confronted officers in the process of charging offenders under the *Criminal Code*.²

In 2005, the Canadian Council of Motor Transport Administrators (CCMTA) developed a new model of administrative sanctions for dealing with low-BAC drivers — that is, those with BACs between 50 and 80 mg/dL.³ The key features of the proposed model included:

- An immediate roadside suspension of 7 to 14 days for drivers registering a BAC of at least 50 mg/dL on an approved screening device;
- The driver must surrender his or her driver's licence;
- Subsequent infractions within three years will result in suspensions of 30, 45 and 60 days, the length of the suspension increasing with each infraction;
- A second suspension within three years will also trigger a requirement for an impaired driver's assessment from a recognized agency;

* The Standardized Field Sobriety Test consists of three tests, Horizontal Gaze Nystagmus, Walk and Turn, and One-Leg Stand, as prescribed in regulations pursuant to section 254.1 of the *Criminal Code* of Canada. (Note: Part 2 of C-46 changes this to 320.27(1)(a).)

- A third suspension within three years will require the driver to participate in an ignition interlock program;
- All suspensions will be recorded on the driver's record for a period of 10 years;
- Drivers will pay a licence reinstatement fee of \$150 to \$300;
- Drivers can challenge the BAC result by requesting a breath test on an approved evidentiary breath-test instrument.

Although there have been repeated calls to lower the illegal BAC limit in the *Criminal Code* from 80 mg/dL to 50 mg/dL, a program of enhanced short-term administrative suspensions appears to be a viable and effective alternative to criminal sanctions for drivers with BACs below the criminal limit.

Current Status

Since the CCMTA model was released in 2005, several provinces have revised their “warn range” suspension programs by implementing various elements of the new model. For example, most provinces have increased the suspension from 24 hours to either three or seven days. Several jurisdictions (e.g., British Columbia, Alberta, Saskatchewan, and Newfoundland and Labrador) have gone one step further and added the possibility of a period of vehicle impoundment to the suspension. Manitoba includes a provision for a seven-day suspension if there is a passenger in the vehicle under 16 years of age. In most jurisdictions, repeat suspensions can result in a longer suspension and can include a requirement to attend alcohol assessment and a remedial program, and possibly install an alcohol ignition interlock.

Several jurisdictions have extended the use of short-term administrative suspensions to include drivers who appear to be affected by drugs or perform poorly on the Standardized Field Sobriety Test. The legalization of non-medical cannabis has been associated with the addition of zero tolerance for drugs for novice drivers (those in the graduated licensing program). Several jurisdictions also include drivers under the age of 22 in the zero tolerance rule. The Appendix summarizes current short-term pre-conviction administrative sanctions for each province and territory. The Appendix also includes the rules surrounding driving after using alcohol or drugs for novice (and young) drivers and the pre-conviction administrative sanctions imposed for a *Criminal Code* impaired driving violation.

What the Evidence Says

Administrative suspensions are based on the fundamental principles of deterrence theory: swiftness, certainty and severity. The suspension takes effect immediately, at the side of the road. There is a high certainty that the suspension will be applied if the driver blows over 50 mg/dL on an approved screening device. Although a 24-hour suspension is not generally perceived as a severe sanction, suspensions of even three or seven days increase the severity, especially when coupled with vehicle impoundment and monetary penalties.

Although short-term administrative suspensions have been around for several decades in Canada, the most common form of administrative licence suspension (ALS) was introduced in the United States in the 1980s for suspected impaired drivers who had a BAC over 80 mg/dL or who refused to provide a breath test. The suspension was issued at the time of the offence and usually became effective within 21 days of the violation. This form of ALS proliferated across the United States and every province and territory in Canada implemented some form of ALS for drivers who failed (i.e., over 80 mg/dL) or refused a breath test.

ALS was intended to increase the certainty a violator would serve a period of suspension (typically 90 days) and enhance the speed with which the action was taken. There exists a considerable body of scientific evidence demonstrating that this form of ALS is an efficient, effective means of improving road safety by removing high-risk drivers from the road quickly. Several evaluation studies in the United States demonstrate that ALS serves as an effective specific and general deterrent, reducing the probability of repeat violations and crashes among those issued administrative suspensions⁴ and preventing others from driving after consuming alcohol.⁵

General and specific deterrent effects of ALS have also been found in Canada. In Manitoba, there was a 27% decrease in driver fatalities with a positive BAC and a 44% reduction in repeat impaired driving offences among those subjected to ALS in the four years following its introduction.⁶ In Ontario, ALS was associated with a 14% decrease in single vehicle nighttime casualty crashes.⁷

Enhanced administrative suspension programs in British Columbia and Alberta provide even greater deterrence by not only increasing the length of the suspension, but coupling it with vehicle impoundment. Evaluations of the impact of the B.C. program revealed a 44% decrease in the proportion of drivers on the road at night with BACs of at least 50 mg/dL⁸ and a 40.4% decrease in alcohol-involved fatal crashes.⁹ Alberta reported a 46% decrease in alcohol-involved fatalities in the six months following the introduction of the new sanctions.¹⁰

The impact of all short-term administrative suspensions on alcohol-involved driver fatalities in Canada from 1987 through 2010 has recently been examined. After accounting for a number of factors known to be associated with traffic fatalities (e.g., per capita beer consumption, unemployment rate, percentage of youth in the population), short-term administrative suspensions were associated with an overall 3.7% decrease in fatally injured drivers with BACs of at least 50 mg/dL. Decreases of 2.9% and 2.6% were also observed in driver fatalities with BACs greater than 80 mg/dL and 150 mg/dL, respectively. No changes were found in the rate of impaired driving charges.¹¹

Limitations

In both British Columbia and Alberta, in addition to the enhanced administrative sanctions for low BAC drivers, new administrative sanctions were also implemented for drivers with BACs over 80 mg/dL. For example, in British Columbia, the sanctions for higher BAC drivers include an immediate 90-day suspension and a 30-day vehicle impoundment, installation of an alcohol ignition interlock and participation in the Responsible Driver Program — a remedial education program.

Enhanced administrative sanctions have been subject to legal challenges. The challenges have primarily focused on the sanctions imposed on drivers found with a BAC over 80 mg/dL. In British Columbia, court rulings have largely upheld the programs, but have prompted the government to enhance the appeal procedures available to drivers and make other minor changes to the program, including a requirement to re-calibrate ASDs to read “Warn” at a BAC of 55 mg/dL, rather than 50 mg/dL to account for possible measurement error.

In British Columbia, drivers with BACs over 80 mg/dL can be issued administrative sanctions but might not necessarily be charged under the *Criminal Code*. The decision not to charge can be viewed as a means to circumvent or avoid the time and effort required to process criminal charges. It has been claimed that this amounts to a de facto “decriminalization” of impaired driving and denies the accused the right to a review of the charges by a court.

Gaps

The enhanced program of administrative sanctions for drivers with low BACs in British Columbia and Alberta also included more severe administrative sanctions for drivers with higher BACs (i.e., over

80 mg/dL). Because these new measures were implemented at or about the same time, it is impossible to distinguish the unique and separate impact of the sanctions for drivers with BACs of 50–80 mg/dL versus those with BACs over 80 mg/dL. Any sustained, long-term benefits of these measures have yet to be determined.

What Other Countries Are Doing

Although it is difficult to draw comparisons with the legal systems in other countries, it appears that the use of short-term administrative sanctions for low-BAC drivers is unique to Canada. Other countries might remove impaired drivers from the road to prevent their continued operation of the vehicle, but immediately suspending for several days the licence of a driver with a BAC lower than the criminal limit appears to have no precedent. Enhanced administrative sanctions that include provisions for immediate vehicle impoundment several provinces are also unique.

Conclusion

As an alternative to lowering the BAC limit in the *Criminal Code*, provinces and territories have used the powers in their highway traffic legislation to deal with drivers who are affected by alcohol or drugs by using short-term, immediate administrative licence suspensions. Amendments in several provinces have taken short-term administrative suspensions to the next level by adding vehicle impoundment, monetary penalties and licence reinstatement fees.

Extending short-term administrative suspensions and impoundments to those affected by drug use is gaining acceptance and several jurisdictions have introduced suspensions for drivers who are affected by drugs that are equivalent to those for alcohol (see Appendix). The criterion for these suspensions is often poor performance on the Standardized Field Sobriety Test or a positive oral fluid drug screening.

Zero tolerance for alcohol and drug use by novice and young drivers has been enacted in every jurisdiction in Canada. These laws help teach young and new drivers to begin their driving careers without the added risks associated with alcohol and drug use.

In addition, because administrative sanctions can be somewhat controversial, it is imperative that the impact of these measures on road safety be documented. Evaluation research must be conducted to determine the nature and extent of changes in impaired driving behavior, charges, and crashes.
